

Classification of Twitter links

We are looking for a master/bachelor student who is interested in natural language processing to work under supervision of Yousef Younes as part of the DFG project UnknownData. The candidate is expected to provide an effective NLP model for finding dataset links in Twitter data. We will provide both access to a Twitter crawl and a list of known dataset links. The task will be to use classification algorithms and/or other NLP techniques to find those automatically.

This task is very similar to the task in paper [1] and the candidate may use similar methodology or choose something else entirely.

For further information concerning the task please contact Yousef Younes via yousef.younes@gesis.org
